

## Rental Property Owner Report

**Dear Jenny,**

Congratulations on completing your own home energy assessment. This is an important step towards improving the energy efficiency of your home.

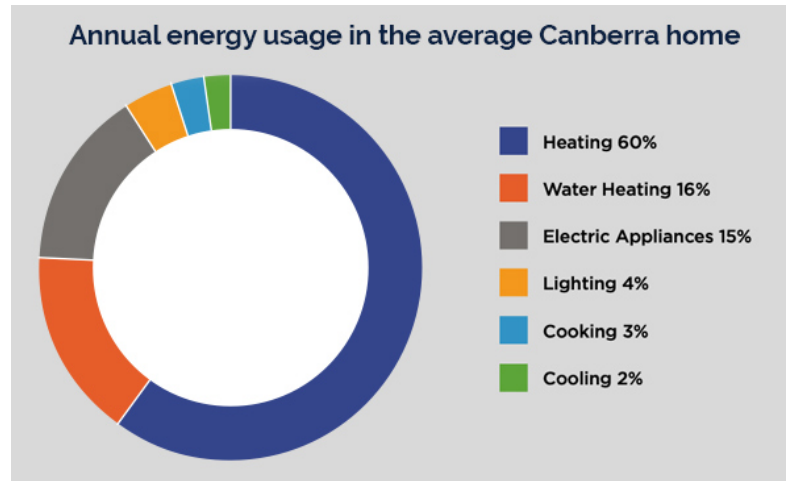

Taking action on recommendations in this report will improve your comfort, save you money and help protect the environment.

This report focuses on actions you can take as the owner of the property. At the end is a link to a second report which focuses on actions that you and your household can take living in the home relating to specifics such as appliance use and your energy bills.

Your energy usage is likely to be similar to the graph on the right. You are likely to achieve the most savings by reducing heat loss during winter and using heaters efficiently.

When you've read your recommendations, check out the links and resources at the end of this report and at [www.climatechoices.act.gov.au](http://www.climatechoices.act.gov.au).

If you live in the ACT, you can get free expert advice on saving energy in your home including additional support implementing these recommendations or checking your bills, by calling the ACT Sustainable Home Advice line on 1300 141 777 or emailing [SustainableHomeAdviceProgram@act.gov.au](mailto:SustainableHomeAdviceProgram@act.gov.au).

The size of the area you are heating, the number of hours heaters are on, and the temperature setting all have a big impact on your bills. In summer a comfortable and cost-effective range to set the thermostat is 25-27°C, and in winter it is 18-20°C

test test

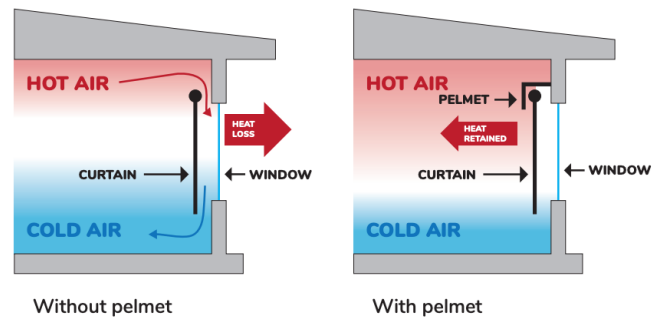

If you found your home energy assessment and report useful please let your friends, family and networks know.

# Windows and draughts

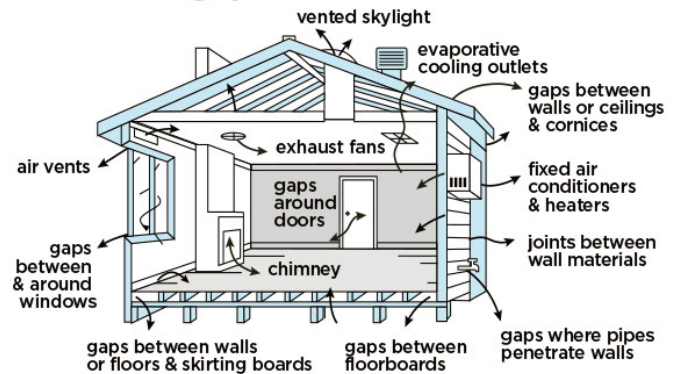

## Your recommendations

- Also, installing pelmets above the blackout curtains would increase the Energy Efficiency Rating of the property, improving the value of the property.

You can find more detailed information about draught-proofing, window insulation and window coverings in the links at the end of this report.

## Find & fix gaps

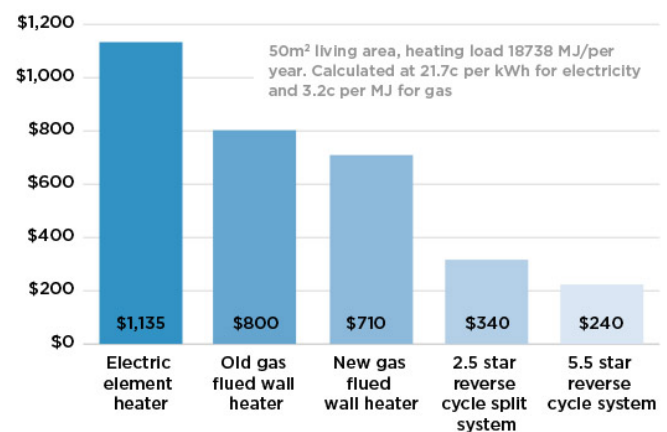

# Heating

## Your heating recommendations

- Regularly check and clean the dust from your air conditioning vents and filters to ensure your system is running as efficiently and safely as possible. This can reduce running costs by 5-15%.

There is more information about heating your home in the links at the end of the report.

Approximate annual cost to heat a large living area in Canberra

# Cooling

## Your cooling recommendations

- Keep your home cooler in summer by opening your windows, doors and curtains when it cools down at night, then closing them in the morning as soon as it starts to get warm outside.

- Air conditioning units should be serviced annually. This will extend the life of the unit, saving you money in the long term
- If you are thinking about buying a new cooling appliance, check the energy star rating labels (see <https://www.energyrating.gov.au/>). More stars mean more energy-efficient. Choosing a more energy-efficient cooling appliance will reduce energy consumption and help lower energy bills.

Fans are an extremely cost-effective way to keep cool in summer - they cost only 1 to 2 cents per hour to run.

---

## Appliances

### Your appliances recommendations

- You can find out how much each of your appliances is costing you by getting a plug-in power meter (see photo). It will show how much power the appliance has used since it was plugged into the meter and will calculate the cost. You can buy power meters at hardware stores or online.
- When the time comes to buy a new appliance, check the energy star rating labels (see <https://www.energyrating.gov.au/>). More stars mean greater energy efficiency. Choosing a more energy-efficient appliance will reduce energy consumption and help lower energy bills.
- A new, efficient dryer could save considerably on running costs. It is now possible to buy heat pump dryers with 10 star energy rating.

## Hot Water

### Your recommendations

- Insulate all pipes going into and out of your hot water unit with foam tubing, known as lagging,

Pipe insulation (often called lagging) is low cost and readily available from most

to prevent heat loss, especially the two metres closest to your water heater.

- Ask an electrician to check that the hot water storage tank thermostat is set at 60 degrees. Running costs will be higher if the temperature is set any higher. (To prevent the growth of Legionella bacteria in the tank, the thermostat should never be set lower than 60 degrees).

- If you are the energy account holder and the account is with ActewAGL you may be able to get discounts of up to \$750 for replacing an old, inefficient hot water heater with a high efficiency hot water heat pump. For more information see <https://www.actewagl.com.au/support-and-advice/save-energy>.

- A 3 star showerhead will halve the amount of hot water and energy used per minute. Note: the property owner will need to give permission and engage a licensed plumber to install a new showerhead in the ACT.

Hot water heat pumps are significantly more energy-efficient than conventional water heaters.

hardware outlets. Insulate the first 2m of exposed pipes from your hot water unit, especially those carrying hot water.
